### Pinout (Top view)

SOT23-5

Name	NO	Pin Description
OUT	1	Output pin, decoupled with a 10µF capacitor to GND.
GND	2	Ground pin
ISET	3	Current limit programming pin. Connect a resistor $R_{SET}$ from this pin to ground to program current limit: $I_{LIM}(A) = 3300 / R_{SET}(\Omega)$
EN	4	ON/OFF control. Pull high to enable. Do not leave it floating.
IN	5	Input pin, decoupled with a 0.1µF capacitor to GND.

Note 1: Stresses beyond the "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

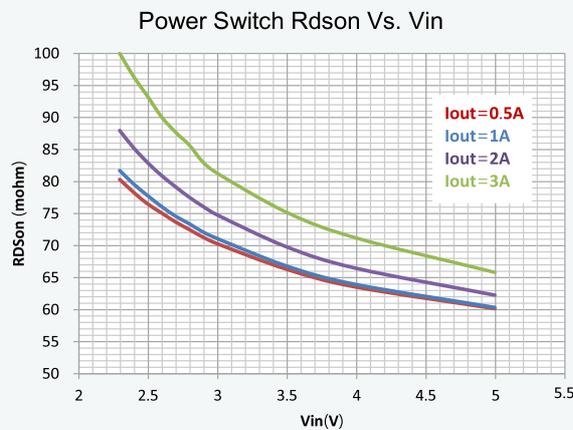

Note 2:  $\theta_{JA}$  is measured in the natural convection at  $T_A = 25^{\circ}C$  on a Silergy's test board. The pin 2 of SOT23-5 package is the case position for  $\theta_{JC}$  measurement.

Note 3: The device is not guaranteed to function outside its operating conditions.

Note 4: Guaranteed by design but not production tested.

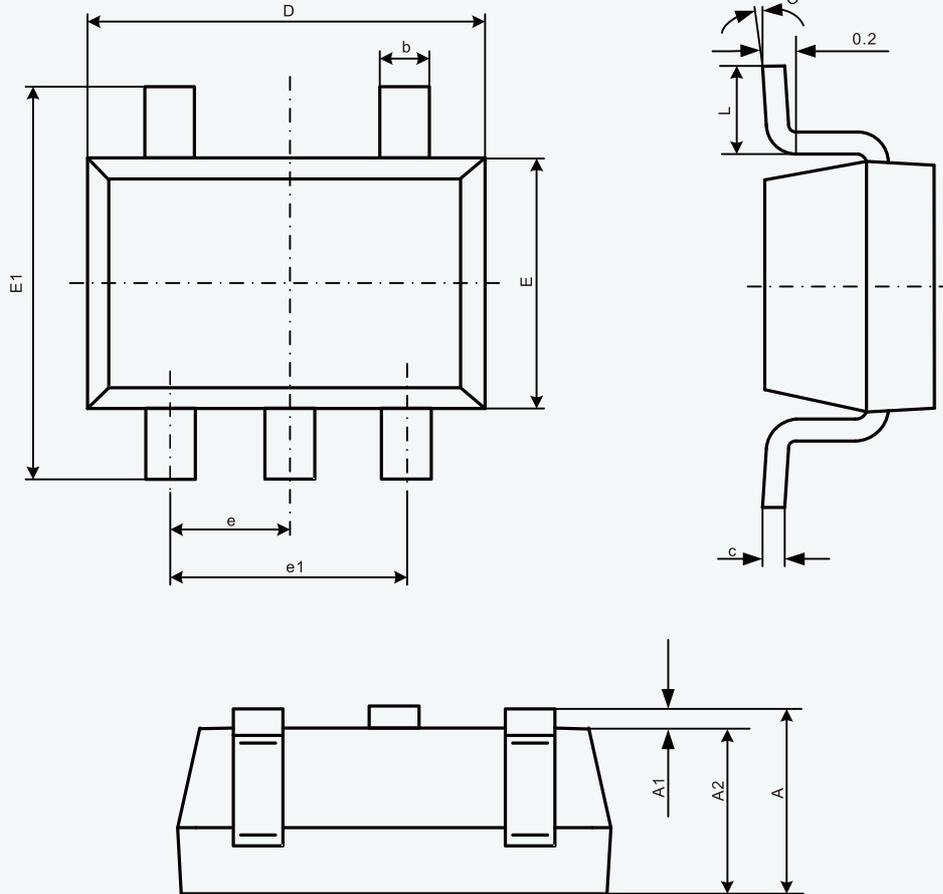

Note 5: Current limit threshold is determined by  $I_{LIMIT}=3300/R_{SET}$ , where  $R_{SET}$  is in  $\Omega$ .

### TYPICAL CHARACTERISTICS (Typical values are at $T_A = 25^{\circ}C$ unless otherwise specified.)

### Precautions for MOS Circuit Operation:

Static electricity can be generated in many places. The following precautions can effectively prevent MOS circuit from being damaged due to the sound of electrostatic discharge:

- Operators shall be grounded through anti-static wrist strap.
- The equipment enclosure must be grounded.
- Tools used during assembly must be grounded.
- Conductor packaging or anti-static materials must be used for packaging or transportation.
